2020 – A REVIEW

BY BARTON ROBINSON

Everyone will have their own perspectives about the previous year and I hope you are all healthy and well. For us at Velocity Software, 2020 ended up being a very productive year. Moving our datacenter from California to Ohio, purchasing a brand new z15 T02, and then showing off the IBM Z technology by implementing a full blown z/VM SSI complex, creating a cloud environment, and then cloning 155 Linux servers in 20 minutes - and we did this in 2 days (see page 3/4). Truth in advertising, we did not use any of the IBM software other than z/VM and RACF. Implementing zPRO with its zDIRECT component as the directory management facility, the solution proved to be simple, elegant and very straightforward to install. And we have several new customers that are ecstatic about a simple, elegant solution that just works!

With less travel, we've had more time to expand our products in areas we believe z/VM installations have real needs. zPRO now has support for RACF management in addition to the existing RACF support normally used for managing the security of a z/VM implementation. Spool management was added, and there is now a scheduler component that is already successfully competing against IBM's Operations Manager and VM:Schedule for most functions.

What is the major drawback today for z/VM? The ancient 3270 interface that nobody coming out of school today (or even most of your users) considers acceptable. Our mission is to zPRO (as a verb) the platform and make it attractive to your users. And provide modern interfaces to manage the platform as well.

zVPS was not left out of our efforts. The z/VM support of course was enhanced, but so was the z/VSE support and the z/OS support. We keep ramping up our CICS workloads to see how much we can handle, and at 100 transactions per second, we don't even see a blip in the data processing requirements. zTUNE has also been enhanced, and will soon support z/OS performance - if you have a performance problem, and if we know what to look for, we'll put that into the rules and give you the report of what was measured and what the corrective options are as we do for z/VM and Linux today.

We are redefining zVIEW, our graphical interface to performance data. It really has become the "z" View, your "View" on your "z" . Presenting z/OS, z/VM, Linux, CICS, z/VSE all on one easily user defined view definitely makes it the z View.

MAINFRAME TO CLOUD IN TWO DAYS!

Enabling and managing a private Linux Cloud on a z15 T02 and z/VM

For the first time in our company's history we participated in IBM's ESP program for the new Z15 T02. And let me tell you these last couple of months have been a pretty cool journey and experience.

From the time that we decided to pursue this idea, I gave my team a very clear project: I want us to go from "Metal to Cloud in two days" – and our team took on the challenge.

Don't get me wrong, our Cloud on Z is very real and we have been running some of our core corporate projects on it and have helped many customers worldwide implement their Cloud on Z using zPRO, our Cloud Enablement and Management tool.

Building the new environment from zero to full Cloud in two days was a different story, but I know our technology. If this new machine was anything like I had expected, I was sure that it was possible.

**CLOUD ON Z?
ONLY WITH ZPRO:
FAST, EASY,
FURIOUS!**

We made that happen: our team managed to install z/VM 7.1 in a 4-way SSI cluster with TCPIP, RACF and our Velocity Software cloud enablement and management software suite zVPS and zPRO in only two days and cloned a total of 155 servers in less than 20 minutes. And just to show the speed of the z15 and the DS8910F disk subsystem, we cloned 50 2GB Linux servers in only three minutes!

With this we've proven that Cloud on Z is real, resilient, secure, easy and extremely fast with the new z15 T02, DS8910F disk subsystem, and Linux on z/VM.

So before you trust someone else to run your corporate and core business on their cloud, leverage this great platform! We at Velocity Software now have all the experience we need to show you how to run your private Cloud on Z.

We want to thank our business partner Vicom Infinity and the IBM ESP team, who have been guiding and supporting us in the past three months to make things happen.

zPRO VERSION 5 RELEASED IN 2020!

BY JAMES VINCENT

zPRO, Velocity Software's premier Linux on Z cloud management solution has had plenty of new and exciting features added this year. Although zPRO's main purpose is to make provisioning and management of your Linux on Z server farm simple and fast, it is also for helping to manage your z/VM system too! Some additions with Version 5 include:

VM Security

zPRO will help you find, report and manage security rules within your External Security Manager (ESM). When you need to validate or audit security rules, zPRO will help you do that quickly and easily.

As a bonus for sites that use RACF on their z/VM system, zPRO has an "Orphaned Userids" report that will show you any rules that are in the RACF database that are orphaned after the userid was deleted. RACF does not remove all the security rules for a userid when it is deleted and finding them with RACF reports is not trivial. This new zPRO report will allow you to keep your RACF database content cleaned up fast and painlessly!

VM Spool

Your z/VM spool subsystem health is important to your system running smoothly.

Spool is used for console logs, sending data from a user/system to another and in some cases, even for simple file backup storage! If not managed, your spool usage can grow and fill up, which is not a Good

Thing. zPRO now includes tools to help you review your spool usage by reporting on key resource usage categories, such as users with the most spool files, the largest open spool files (console logs), top spool files by size and more. It also shows the overall system spool space usage and even any dump files that may be on your system. You can find and report on specific categories of spool files or search using your own criteria. We also include a report to show spool files that are unowned.

zPRO'S BUILT-IN SCHEDULER!

BY RICH SMRCINA

The zPRO product has had a need to schedule internal events since its inception. A number of customers have requested a scheduling mechanism along with our other offerings. Velocity Software is pleased to announce that we now have an event scheduler.

It is included as part of zPRO. Along with other new zPRO functions (see the article by James Vincent in this issue), the zPRO Scheduler is part of zPRO 5110. It does require updates to zVWS (the Web Server), so it will need to be updated as well.

The zPRO Scheduler is managed completely via a web based user interface. No 3270 is required.

The web interface allows the user to display the currently scheduled events, create a new event, and delete one or more events.

Figure 1 shows the zPRO menu of available Scheduler functions. Click 'Manage Scheduled Events' to see the current list of events.

Figure 2 shows the current list of events. The list that is generated will show the events owned by the logged on user. If the user is also a zPRO administrator, that user will see all of the events.

The list shows the owner of the event, event name, the system name (in an SSI cluster this will be the cluster name), scheduled date(s), time, the date and time of the last event was last run, the stop time, the interval time for recurring events, the command that is executed, the system ID on which the event will run, and whether the event is currently active.

Under the event name is the description of the event that can be entered when the event is created.

Events owned by SYSTEM are zPRO internal events and can not be deleted.

On the bottom of the list are actions that can be taken. There are currently two actions available, Add and Delete.

From the event list, clicking on the 'Add' button will produce the schedadd dialog. This dialog allows the user to enter information for a new event.

Figure 3:

The Event Name is the name of the event. The Run Date can be a specific date or multiple dates on which the event will be run. The date can also be specific days (MON, TUE, etc) on which to run the event, along with keywords DAILY, WEEKDAYS, WEEKENDS. The days can either be entered in the Run Date field, or use the check boxes to select one or more days. A date can also be one or more date patterns that can represent a specific day (or days) of the month on which to run an event.

Start Time is the time at which to schedule the event, or to start scheduling the event in the case of a recurring event.

End Time is the time at which to stop running the event. This is useful for events that occur multiple times a day, but need to stop running at a certain time.

Occurs Every indicates an event that runs multiple times a day.

All time fields are expressed in 24 hour time and represent the local LPAR time.

The Command field is the command that is executed at

the scheduled event time. It can be a CP command, a CMS command, an EXEC, or a subset of zPRO specific functions.

Using the zPRO functions provides the ability to schedule starting, stopping, or relocating servers at certain times.

The Description field allows for the entry of a comment to be associated with the event.

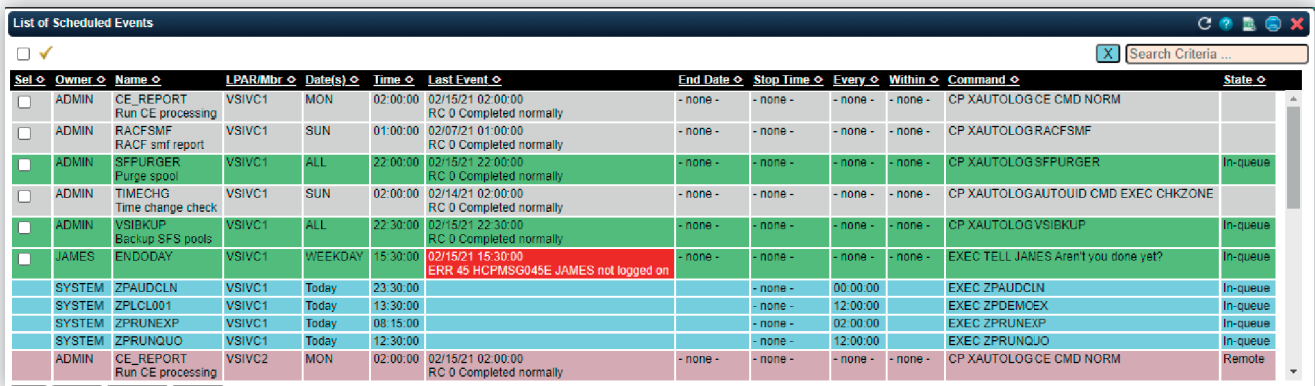

When the required information is entered, press 'Process Request'. The event list will be updated automatically with the new event. If the event is scheduled for any time on the current day, the 'Active' column will indicate that the event is active.

To delete an event, select it from the event list and click the Delete button. A confirmation dialog will appear that requires the user to click 'Ok' to delete the event.

Rich

Rich has been with Velocity Software for over 11 years. He provides customer support and training, and maintains zALERT and zPORTAL. Rich also works on our new product zOSMON and our zIVSE monitor.
